1. Introduction

- 1. The Clean Technology Fund (CTF) of the Climate Investment Funds (CIF) provides scaled-up financing to contribute to the demonstration, deployment, and transfer of low-carbon technologies with a significant potential for long-term greenhouse gas emissions (GHG) reductions. It provides concessional financing, channeled through six partner multilateral development banks (MDBs), to large-scale, country-led projects and programs in renewable energy, energy efficiency, and sustainable transport. CTF supports countries and regions through strategic investment plans, including 15 country investment plans, one regional program in the Middle East and North Africa (MENA), and four phases of the Dedicated Private Sector Programs (DPSP), including the Global Energy Storage Program (GESP).
- 2. This CTF Results Report is based on 103 MDB-approved projects/programs 1 subject to reporting for the 2021 reporting year 2 (RY2021) and is divided into four main sections: a global overview of the results across the five core indicators, results progression, co-benefits reporting, and lessons learned from completed projects. It also includes the following annexes: Annex 1: Summary of results, Annex 2: Direct finance leveraged by source (USD M), and Annex 3: Installed capacity by technology (MW).
- 3. This report is based on results originating from projects and programs in the following countries: Chile, Colombia, Dominica, Egypt, Haiti, Honduras, India, Indonesia, Kazakhstan, Kenya, the Maldives, Mexico, Morocco, Nicaragua, Nigeria, Philippines, South Africa, Thailand, Turkey, Ukraine, Vietnam, and regional and global DPSP projects.
- 4. For the purposes of this report, the countries are grouped into the following regions, with the number in parentheses denoting the number of CTF projects in each location:
 - Africa (AFR): Egypt (1), Kenya (1), Morocco (5), Nigeria (1), South Africa (4), Regional (3)
 - Asia (ASIA): India (9), Indonesia (4), the Maldives (1), Philippines (6), Thailand (3), Vietnam
 (4), Regional (3)
 - Europe and Central Asia (ECA): Kazakhstan (5), Turkey (9), Ukraine (8), Regional (3)
 - Latin America and the Caribbean (LAC): Chile (4), Colombia (9), Dominica (1), Haiti (1), Honduras (1), Mexico (10), Nicaragua (1), Regional (3)
 - Global: Global (3)

¹ Included in these 103 projects/programs are those that have reached completion and are no longer being actively monitored for results by the MDBs. For completed projects, results for GHG emissions reductions, passengers per day, and energy savings continue to accrue unless otherwise indicated.

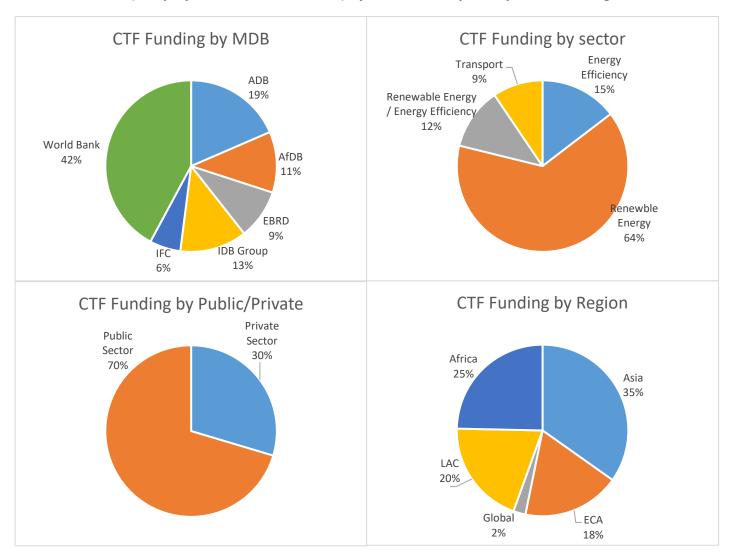

² Reporting year: Depending on the MDB, the reporting year "RY2021" covers the period from January 1, 2020 to December 31, 2020 (AfDB, ADB, EBRD, and IDB Group). Due to the adjustment in reporting schedules, results from the World Bank are reported on a six-month window between July 2020 to December 2020 (for this cycle only). While for the IFC, annual results for annual GHG emissions reductions and annual energy savings are based of those reported from RY2020 (results from 2019), as they are the latest results available and will be used as proxies, given that IFC's results are only released in July. Adjustments will be made ex-post once IFC actual results are reported.

- 5. The RY2021 results portfolio of 103 MDB-approved projects/programs amounts to USD 4.8 billion in total CTF funding. 3 As depicted in Figure 1, the World Bank has the largest share of CTF funding at 42 percent of the total funding allocation, 4 followed by Asian Development Bank (ADB) at 19 percent, Inter-American Development Bank Group (IDB Group) and the African Development Bank (AfDB) at 13 percent each, the European Bank for Reconstruction and Development (EBRD) at 9 percent, and the International Finance Corporation (IFC) at 6 percent.
- 6. By sector, the CTF results portfolio consists of 64 percent renewable energy (RE) projects, 15 percent energy efficiency projects (EE), 12 percent combined RE/EE projects, and 9 percent transport (TR) projects. Funding is split approximately three-quarters for public sector projects and one quarter for private sector projects. By region, Asia has the largest share of funding, at 35 percent, while Africa has 25 percent, LAC 20 percent, and ECA 18 percent. Global projects represent 2 percent of CTF funding.

³ The following seven cancelled projects are included in the results report, since they previously reported results: T-SEF, Renewable Energy II-Kazakh Railways Sustainable Energy Program, Yermentau Large Wind Power Plant, Renewable Energy I-Waste Management Framework, Renewable Energy Program, Residential Energy Efficiency Finance Lending Facility (UREEFF), and Concentrated Solar Power Project

⁴ These percentages differ from those listed in the CTF Semi-Annual Operational Report (SAR) as the set of projects represented by the two reports differs: the CTF Results Report is based on MDB-approved projects subject to reporting results while the portfolio analysis in the SAR is based on Trust Fund Committee-approved projects.

Figure 1: Distribution of CTF projects subject to RY2021 results reporting (103 projects for USD 4.8 billion) by MDB, sector, public/private, and region

1.1 Summary of Key Results

- 7. Results reporting indicates that total CTF investments of USD 4.8 billion have mobilized a cumulative total of USD 23.1 billion in co-financing, including USD 1.66 billion mobilized in RY2021 alone. The private sector, an important co-financier, achieved nearly USD 4 billion.
- 8. These investments have resulted in a cumulative 103 million tons of CO2 (MtCO2) in GHG emissions reductions since the first projects were approved in 2009. This is almost equal to the annual GHG emissions of Belgium or the combined emissions of 20 million cars in one year. On an annual basis, GHG emission reductions increased by 14 percent when compared to RY2020, to reach 21.8 MtCO2 in RY2021.
- In addition, CTF investments have resulted in 8.2 gigawatts (GW) of installed renewable energy generation capacity in RY21, 5,392 gigawatt hours (GWh) in annual energy savings, and 289,868 passengers per day using low-carbon public transit. The following illustration further highlights CTF key results.

1.2 Approach

- 10. The results presented herein are based on the CTF Revised Results Framework, which includes the following core indicators measured at the project level and reported to CIF annually:
 - Tons of greenhouse gas emissions reduced or avoided (tCO₂)
 - Volume of direct finance leveraged through CTF funding, disaggregated by public and private finance (USD million, USD M)
 - Installed capacity as a result of CTF interventions, disaggregated by source if feasible (Megawatt, MW)
 - Number of additional passengers, disaggregated by men and women if feasible, using low-carbon transport as a result of CTF intervention (passengers per day)
 - Annual energy savings as a result of CTF interventions (Gigawatt hours, GWh)
- 11. Each project/program is also required to identify and report on at least one indicator for a development co-benefit. Such examples include increased number of people with access to energy or health and employment co-benefits, disaggregated by gender when possible. Co-benefits generated in the CTF portfolio are further explained in Section 3.
- 12. The MDBs collect results data for CIF annually, following the CTF Monitoring and Reporting Toolkit and directly report their data in the CIF Collaboration Hub (CCH). The results section of the CCH was launched in spring 2020, with the CIF Administrative Unit conducting training sessions for MDBs in June and July.

1.3 Definitions and Analytical Notes

- 13. It should be noted the COVID-19 pandemic has been also a factor in project implementation since 2020. It has caused delays, temporary work stoppages, difficulty in mobilizing material and consultants due to travel restrictions, and reduced investment levels. Project teams have been adjusting to the situation, and as it progresses, the CIF Administrative Unit will continue to monitor the impact on CTF.
- 14. The following definitions and considerations apply to the entire report.
- 15. Indicators: Tons of GHG emissions reduced or avoided (tCO₂) and volume of direct finance leveraged through CTF funding are core indicators that every project and program must report on for installed capacity, number of additional passengers using low carbon transport, and annual energy savings depends on the nature of the project (i.e., whether the project involves renewable energy, transport, or energy efficiency measures).
- 16. Reporting: Projects report indicators according to the best available information. In some cases, information is based on direct measurements or evidence, such as megawatts (MW) of installed capacity. In other cases, it is based on ex-ante engineering estimates (e.g., number of houses built, multiplied by estimated energy savings per house). In many cases, data are obtained through a combination of direct measurements and ex-ante estimates. Previous years' results may change from one year to the next as better information becomes available, or if projects are restructured and targets are scaled up or down, depending on the nature of the restructuring.
- 17. New reporting cycle: Following the November 2020 SCF Intersessional Meeting, the SCF Trust Fund Committee reviewed and approved Option 2. While the decision was reached for the SCF rather than CTF committee, the CIF is striving to align all CIF reporting with this adjusted timeline of one annual

- meeting in June to ensure consistency across CIF. Therefore, the results reporting for CTF shifted from November to June.
- 18. Reporting year (RY): Reporting year refers to the one-year reporting period associated with that year. RY2021 is the most recent reporting year and refers to the period January 1, 2020–December 31, 2020. While the decision to shift the reporting cycle to coincide with the June Committee meetings has been beneficial as it shortens the lag of the reporting cycle, it has resulted in an unintended consequence to IFC results reporting. The IFC data collection cycle runs over a four month period annually from April to July for results achieved in the previous calendar year. Therefore, the decision to adopt a new reporting cycle means that going forward the results from the IFC data will be for the prior reporting year (i.e., CY2019). As a result, IFC results data will be on a one-year lag relative to that of other MDBs.
- 19. Actuals: This refers to the actual realized results reported by a project for the latest 12-month reporting period. 6 "Actual (cumulative)" refers to total actual results achieved since the project started reporting results. Related, "reported results" refers to actual results that are more than zero.
- 20. *Targets:* In the case of GHG reductions or energy savings, targets refer to amounts expected to be achieved on an annual basis (although GHG reductions have a corresponding lifetime target as well). For other indicators, targets refer to absolute results expected to be achieved during the course of the project or by its completion. The words "target results" and "expected results" are used interchangeably. They refer to a mix of targets for public sector projects (from MDB board-approved documents) and for private sector programs (from CTF Trust Fund Committee-approved documents).
- 21. Co-financing: Different MDBs take different approaches to reporting on actual co-financing. This includes establishing milestones when MDBs recognize co-financing and identifying the relevant co-financing amounts. While some MDBs report the full amount once a project is approved by the respective MDB board, others do not report until the project reaches financial close, achieves disbursements, or starts operation. Some co-financing figures may not be reported for confidentiality reasons.
- 22. *GHG reductions:* MDBs have started to use harmonized methodologies for estimating GHG emissions reductions; however, GHG calculations are still subject to further refinement as MDBs continue to make adjustments.
- 23. Co-benefits: To better understand the impact of CTF funding, CTF co-benefit indicators look beyond the primary mandatory indicators listed in the CTF results framework. Co-benefits are aggregated and presented on a regional level and only include results from those projects that report them (60 percent of projects covered in this report). Co-benefits vary by project and may include indicators

⁵ For this RY, the World Bank adheres to the July 2020–December 2020 timeframe due to the adjustment in TFC schedules in which the results reports are released in June instead of December, so their results are only reflecting a six-month period as opposed to one year in this adjustment year. Moving forward, their reporting cycle will be from January–December as with every other MDB. Previously it has reported results on a July to June cycle, following its fiscal year.

⁶ Due to the adjustment in reporting year, for this year only, all results from the World Bank are reported for six months, from July to December 2020.

- like reduced local air pollution and employment. In addition the CIF Administrative Unit also maps CTF co-benefits to the Sustainable Development Goals (SDGs) (see Section 3.1.3).
- 24. An initial portfolio analysis of CTF using modeling tools to estimate employment contributions and economic value creation provided first-of-its-kind data on the CTF portfolio (see Section 3.1.3). Building on this analysis, a broader evaluation of development impacts in CIF, with a focus on all four current CIF programs, began implementation and is poised to deliver early findings by the end of 2021. Undertaken by an independent evaluation firm, this mixed method assessment includes additional modeling and country case studies to analyze more deeply impacts on jobs and economic development while expanding the analysis to other areas such as environmental, health, market and trade competitiveness, security, and social impacts, including gender and inclusivity.
- 25. Analysis: The analysis is based on both annual (for the latest reporting year) as well as cumulative results reported as of the current period. The graphs on cumulative emissions reductions, as well as sources of co-financing and installed capacity by technology, are based on cumulative results reported thus far.
- 26. Completed and cancelled projects: Private sector projects that have reached full implementation with funds repaid or public sector projects that have fully disbursed all their funds use the most recent observed value for annual GHG emissions reductions, passengers per day, and energy savings, as projects are expected to continue to perform at demonstrated levels for the remainder of the lifetime of the project. Completed projects are still included in the results described in this report, whereas cancelled projects that have never reported results are removed from the dataset (including their corresponding targets). For partially cancelled projects, the target results are pro-rated based on the remaining funding amount.

1.4 Portfolio Maturity⁸

- 27. Large infrastructure projects, such as those funded by CTF, typically have a long gestation period from approval to the point at which they reach full operational capacity, at which point they start reporting results and move closer to their targets—sometimes quite rapidly or all at once. A project may not report any achieved results for indicators (such as annual emissions reductions, installed capacity, and annual energy savings) for many years, but once the actual infrastructure has been completed, many of these targets may be achieved within one reporting cycle.
- 28. Figures 2 and 3 shows the age of the CTF portfolio from MDB approval through RY2021 by project count and by funding amount. Among the MDB-approved projects, most are in the 5+ year range (40 percent), followed 3-5 year range (27 percent), and finally the 0-2 year range (17 percent). Closed projects still account for only 16 percent of the total CTF portfolio.

⁷ Lifetime of the project means the expected operational life expectancy of the project, not when the project has been marked as completed. This can go beyond 25-30 years after the project completion.

⁸ This analysis is based on data related to CTF approvals. This means that data about private sector programs that include subprojects at different stages (e.g. closed subprojects and subprojects in implementation) is not disaggregated.

Figure 2: CTF portfolio maturity by project count

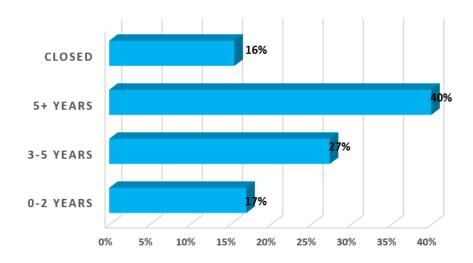

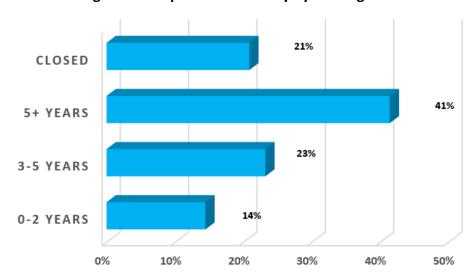

Figure 3: CTF portfolio maturity by funding amount

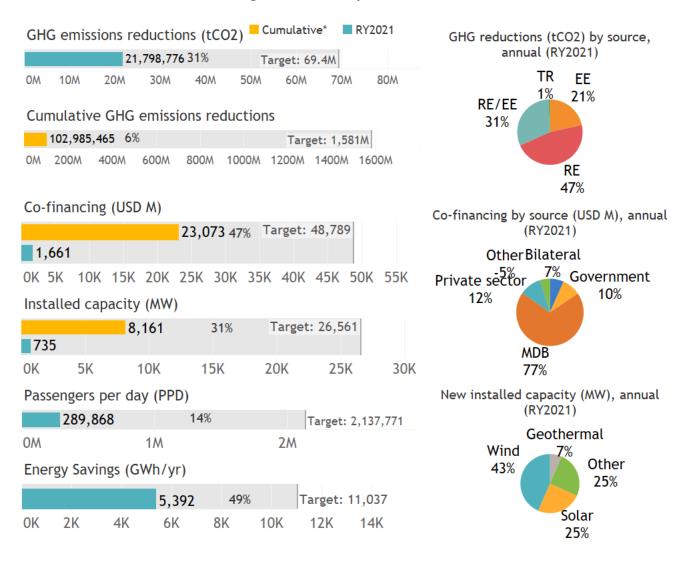

29. Given the maturity of the CTF portfolio, some projects are only beginning to report results, and some have yet to report any results at all, especially given the increase in newly approved projects this RY. The share of projects that are 0-2 years increased from 10 percent last RY to 17 percent this RY. While only half of the CTF portfolio is currently reporting results on the core indicators, considerable results have nevertheless been reported for installed capacity of renewable energy, annual energy savings, and annual GHG emissions reduction.

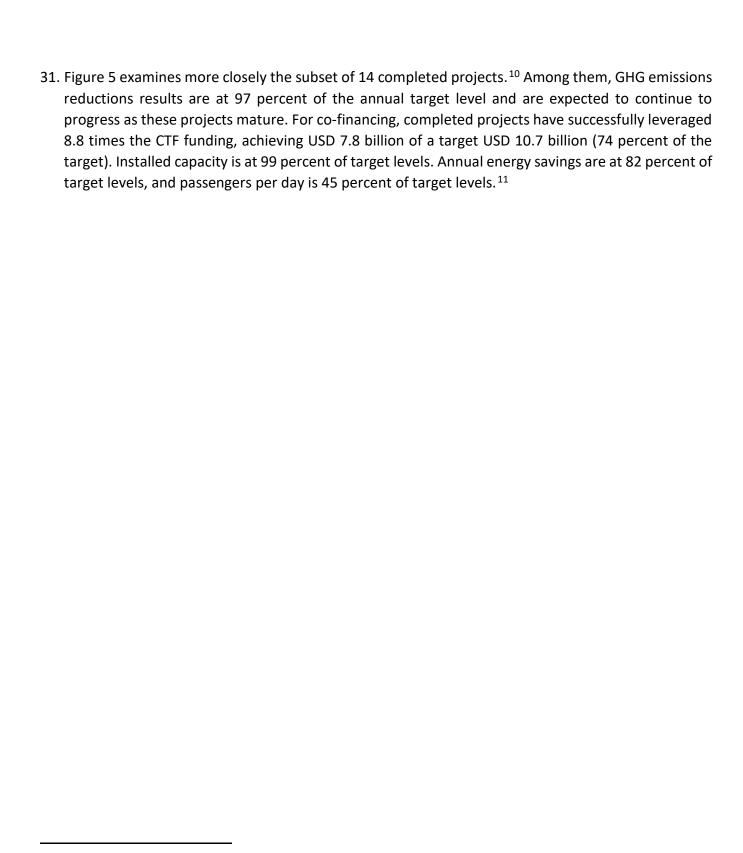

2. Key Results⁹

30. Figure 4 depicts key results reported by 103 projects (USD 4.8 billion in total CTF funding), including 14 projects approved by MDBs in RY2021. See Annex 1 for fully project-by-project results.

Figure 4: Summary of CTF results, RY2021

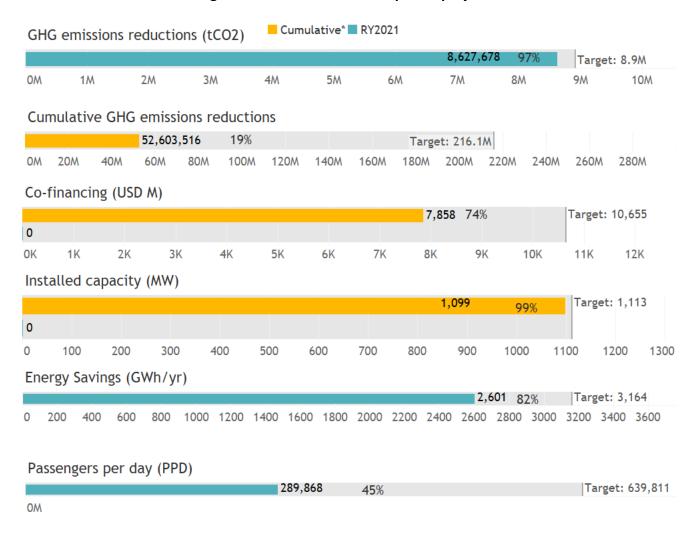

⁹ Annex 2 shows the distribution of results across projects for three indicators: GHG emissions reductions, co-financing, and installed capacity. The top three contributors to results are labeled for each indicator

¹⁰ Results for Development Policy Loan to Promote Inclusive Green Growth and Sustainable Development in Himachal Pradesh are not included given that the project is a developmental loan, meaning that the project immediately closed as soon as the loan was given out. There was no additional monitoring despite the project is ongoing and producing additional results.

¹¹ There are no additional closed projects with an ICR between RY2020 and RY2021

Figure 5: Performance of completed projects 12

2.1 GHG emissions reductions

32. In RY2021, 48 of the 103 projects reported achieved results on annual GHG emissions reductions, totaling 21.8 MtCO₂¹³, equivalent to taking 4 million cars off the road ¹⁴. Cumulatively, GHG emissions reductions total 103 MtCO₂. The majority of cumulative emissions reductions can be attributed to projects in ECA (36 percent) and Asia (33 percent).

¹² Annual figures for energy savings and GHG emissions reductions are post completion proxies based on the numbers reported in the final year of project implementation, and these numbers are not continuously reported to MDBs.

¹³ Throughout this report, MtCO₂ refers to million tons of CO₂.

¹⁴ Source: US EPA Greenhouse Gas Equivalencies Calculator https://www.epa.gov/energy/greenhouse-gas-equivalencies-calculator

- 33. As shown in Figure 4, RY2021 GHG emissions reductions are attributable primarily to renewable energy projects (66 percent), followed by projects in renewable Energy/energy efficiency (18 percent), energy efficiency (16 percent), and transport (less than 1 percent).
- 34. For RY2021, four projects, Shared Infrastructure for Solar Parks in India (World Bank), Private Sector Renewable Energy and Energy Efficiency Project in Turkey (World Bank)¹⁵, Turkey Renewable Energy Integration (T&D) (World Bank), and Private Sector Geothermal Energy Program in Indonesia (ADB) account for just under 50 percent of the annual GHG emissions reductions.
- 35. Out of the 103 MDB-approved projects subject to results reporting in RY2021, 48 projects have reported non-zero results for annual GHG emissions reductions. Taking only these projects into consideration, they have achieved 78 percent of their combined target of 28.2 MtCO₂. This is an increase as compared to RY2020, when the 45 projects that reported non-zero results achieved 58 percent of their annual GHG reduction targets. As per figure 6, most of the achieved GHG emissons reductions since CTF's inception are from projects in the ECA region.

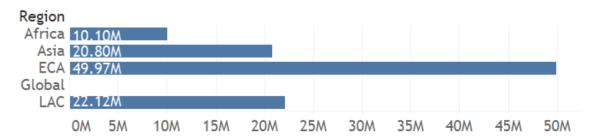

Figure 6: Cumulative GHG emissions reductions by region (tCO₂)

2.2 Co-financing¹⁶

36. In RY2021, 18 of the 95 projects (representing USD 1.67 billion in total CTF funding) realized USD 1.66 billion in co-financing, an amount more than the GDP of Antigua and Barbuda. This brings cumulative co-financing achieved to USD 23.1 billion with 35 percent provided by MDBs, 18 percent by governments and the private sector, 17 percent by other/mixed sources, ¹⁷ and 12 percent by bilateral institutions (see Figure 7). It marks an increase of 10 percent from USD 21 billion achieved in RY2020.

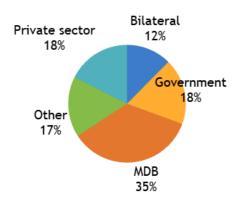

USD 1.66 billion in RY2021 co-financing, equal to the GDP of Antigua and Barbuda

¹⁵ Annual GHG emissions reduction from this number is a proxy based off the final GHG emission reduction reported prior to the project's completion.

¹⁶ No data has been received from IFC for RY2021 (CY2020).

¹⁷ Other sources include, for example, the European Investment Bank and the EU Neighborhood Investment Facility.

Figure 7: Cumulative co-financing by source

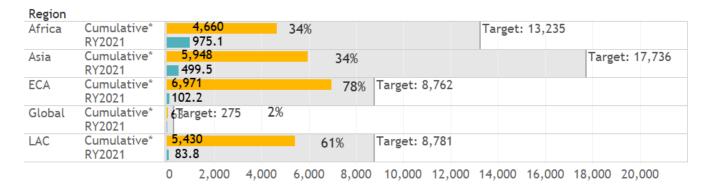

- 37. Cumulatively, Africa has received the largest portion of funding from MDBs (USD 1.7 billion). Much of this is due increase in achieved co-financing from the joint World Bank-AfDB supported Noor II and III CSP in RY2021. Bilateral sources from partner institutions, such as the European Investment Bank, Agence Francaise de Developpement, and KfW Development Bank, also have a large share (28 percent) due to their support of large-scale CSP projects in Morocco: Noor Ouarzazate I and Noor II and III.
- 38. Asia and ECA have received most of their cumulative co-financing from MDBs (USD 2 billion and USD 3.6 billion, respectively), and LAC has received much of its co-financing from other/mixed sources (USD 2.1 billion), such as third party investors.
- 39. In ECA, MDB co-financing has been leveraged by 16 of 20 projects, and the region is closest to achieving its targets. In the LAC region, more than one-third of total co-financing has been leveraged from other sources, most of which is attributed to the Mexico Renewable Energy Program (IDB Group). It accounts for over 36 percent of the co-financing achieved in the LAC region. ¹⁸
- 40. At a project level, the Mexico Renewable Energy Financing Facility (IDB Group) and the Turkey Private Sector Renewable Energy and Energy Efficiency Project (World Bank) account for the largest share of cumulative co-financing: almost 22 percent of the overall share. Both have overachieved their co-financing target, by 106 percent and 20 percent, respectively.
- 41. As indicated in Figure 8, ECA continues to leverage the largest amount of co-financing on a cumulative basis (USD 7 billion). Among the regions, ECA is also closest to achieving its cumulative co-financing target, at 80 percent of the cumulative target level.

¹⁸ Co-financing for this program reported as "other" includes private equity and lending from private and public banks.

42. Out of the 95 projects subject to results reporting in RY2021, 65 have reported non-zero results from at least one source of co-financing. Taking only these projects into consideration, they have achieved 58 percent of their combined target of 39 billion.

Figure 8: Cumulative and RY2021 co-financing by region compared to target levels (USD million)

2.3 Installed Capacity

43. In RY2021, 11 projects reported achieved annual installed capacity of 735 MW, bringing the cumulative installed capacity up to 8.2 GW, almost the total installed capacity of Ecuador. ¹⁹ Of the 68 CTF projects with an installed capacity target, 36 have reported achieved results for this indicator.

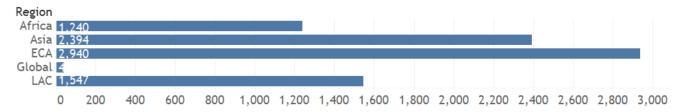

8.2 GW
almost equivalent to
the installed capacity
of Ecuador

- 44. Wind is the largest source of annual installed capacity for RY2021, at 319 MW, most of which is from the Renewable Energy Integration Project in Turkey (World Bank). It alone added 199 MW in installed capacity. Other/mixed comes at second at 185 MW followed by solar at 182.7 MW and geothermal at 48 MW.
- 45. To date, 30 percent of the cumulative target for installed capacity has been met, with the Shared Infrastructure for Solar Parks Project in India (World Bank) accounting for the largest share of the achieved cumulative installed capacity at 12 percent. ²⁰ Solar also accounts for the largest portion of cumulative installed capacity at 3,436 MW overall or 42 percent.
- 46. Figure 9 shows cumulative installed capacity by region. ECA has the largest amount of cumulative installed capacity (37 percent), while it is also the region that saw the largest increase in installed capacity in RY2021 at 541 MW.
- 47. Out of the 68 projects that have installed capacity targets, 39 have reported non-zero results from at least one source of installed capacity, an increase from 34 projects in RY2020, or 14 percent. Taking only these projects into consideration, they have achieved 73 percent of their combined target of 11 GW.

¹⁹ https://www.cia.gov/library/publications/the-world-factbook/rankorder/2236rank.html

²⁰ CTF- funded smart grid activity, in combination with the generous FIT, enabled the large RE expansion. CTF funds did not directly finance RE capacity installations

Figure 9: Installed capacity by region (MW)

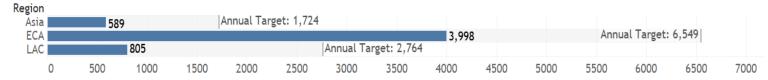

2.4 Energy Savings

48. Of the 27 projects that have a target for energy savings, 19 have reported achieved results for this indicator. ²¹ Annual energy savings for CTF-financed projects in RY2021 totaled 5,392 GWh, almost the amount of the annual electricity produced in Moldova. ²² These reported energy savings were primarily in ECA (76 percent), where the majority of energy efficiency projects are located.

Energy savings equal to the energy produced by Moldova

49. The Private Sector Sustainable Energy Financing Facility (TurSEFF) (EBRD) and the Private Sector Renewable Energy and Energy Efficiency Project (World Bank) in Turkey account for the largest portion of RY2021 energy savings at 26 percent and 25 percent of the total, respectively. Aggregated over the entire portfolio, annual energy savings are at 50 percent of the annual target level. As shown in Figure 10, ECA is the closest to achieving annual energy savings at 65 percent of the target level.

Figure 10: Energy savings by region (GWh)

2.5 Passengers per day

50. Besides the three transport projects that were completed in RY2020, no other transport projects reported additional results in RY2021. The other transport projects in Vietnam and Philippines have extended their closing date by a couple years due to delays ranging from operational issues to the ongoing COVID-19 pandemic.

3. Results Progression

51. The following section is based on RY2018 to RY2021 data for the 103 projects subject to results reporting²³. It should be noted that RY2018, RY2019, and RY2020 figures have been adjusted to

²¹ One project is from IFC which reported results in RY2020, in which their numbers are used as a proxy for RY2021 due to the adjustment in reporting cycle from November to June.

²² https://www.cia.gov/library/publications/the-world-factbook/rankorder/2232rank.html

²³ Some of these projects were approved as recently as 2019, and therefore have not begun to show non-zero results for CTF indicators.

- account for new data that were not available when the 2018, 2019, and 2020 CTF results reports were released. Figure 11 shows year-to-year comparisons for the five core CTF indicators.
- 52. The amounts of incremental funding leveraged and capacity installed vary by year depending on the maturity of individual projects. No new installed capacity or co-financing are added once a project has reached completion, while emissions reductions, energy savings, and passengers per day are expected to continue to progress throughout a project's operational lifetime.

Figure 11: CTF results progression for previous three reporting years, by indicator

53. **GHG emissions reductions:** GHG emissions reductions in RY2021 were 14 percent higher than that of RY2020. Four projects, District Heating Modernization Program/Green Cities in Ukraine (EBRD), DPSP III: Finance and Technology Transfer Centre for Climate Change (FINTECC): Ukraine Agribusiness and Waste Residues Window (EBRD), Second Urban Infrastructure Project in Ukraine (World Bank), and DPSP III: Innovative Instruments for Investment in Zero-Carbon Technologies (i3-0) in LAC (IDB Group) reported emissions reductions for the first time. For the 33 of 41 projects that have reported

250K

291,020

289,868 289,868

300K 350K

- achieved reductions in all three years, GHG emissions reductions either remained stable or increased.
- 54. **Co-financing:** The additional co-financing leveraged in RY2021 (USD 1.66 billion) was primarily due to the Noor II and III CSP Project in Morocco (AfDB–World Bank), accounting for over 60 percent of the achieved co-financing this year.
- 55. Installed capacity: RY2021 saw a slight increase in installed capacity. Cumulative installed capacity increased by 9 percent between RY2020 and RY2021 to reach 8,161 MW. Three projects, Second Power Transmission Project in Ukraine (World Bank), DPSP III: Finance and Technology Transfer Centre for Climate Change (FINTECC): Ukraine Agribusiness Waste Residues Window (EBRD), and DPSP III: Innovative Instruments for Investment in Zero-Carbon Technologies (i3-0) in LAC (IDB Group) reported results for the first time.
- 56. **Energy savings:** The decline in annual energy savings is due to reductions in achieved results from existing projects. While one project, District Heating Modernisation Program (EBRD), reported results for the first time in RY2021, seven projects saw a decline in annual energy savings. This is likely due to the adjustment in reporting period. World Bank projects, which account for 54 percent of the achieved energy savings results in RY2021, are only reporting results for half a year, as opposed to a whole year.
- 57. Passengers per day: After the first achieved results for passenger numbers were reported in RY2016, progress on passengers per day has steadily increased from RY2017 to RY2020. However in RY2021, no additional projects (besides those that have been completed) are reporting numbers on passengers per day, keeping this number the same at 289,868 people. The remaining six transport projects continue to face implementation delays due to various issues ranging from resettlement matters, procurement issues, and regulatory barriers. The Technological Transformation Program for Bogota's Integrated Public Transport System in Colombia (IDB Group) reported 64,020 passengers per day in RY2020, the Mexico Urban Transport Transformation Project (World Bank) reported 225,848., and the Energy Efficient Electric Vehicles Project in the Philippines (ADB) added another 17,000 passengers per year benefiting from low-carbon transport.

3.1 Distribution of Results Among Projects

3.1.1 Portfolio Evolution

58. What was once considered frontier clean technology 10 years ago is now more conventional and relatively cheaper. To keep up with pioneering technology that entails a higher level of risk and would benefit more from concessional financing, the composition of the CTF portfolio has shifted over the years. Many early CTF projects were traditional renewable energy infrastructure projects whose goal was to add a certain amount of installed capacity into the grid. The more recently approved CTF projects are more focused on working with multiple technologies to support innovation across different areas of clean energy. As seen in Figures 12 and 13, projects that were approved early on usually worked with one specific technology, while projects approved at later years tend to work with multiple technologies.

- 59. This is also evident in the average level of financing in these two sets of projects. The projects that were approved early on tend to be larger, at around USD 59 million, while those that were approved in the last three years have an average CTF financing of USD 39 million. This suggests that the size of CTF projects has decreased over time.
- 60. These two trends suggest that, while CTF's mission remains the same (supporting clean energy development in low and middle-income economies), how it is achieved has shifted over the years. Initially, the investment was in building the infrastructure to demonstrate the potential of a particular technology. More recently, CTF financing is more focused on enabling smaller projects executed by local businesses and the private sector, thus working on multiple sources of technology.

Figure 12: Distribution of technologies in CTF projects first reporting results between RY2012 and RY 2014

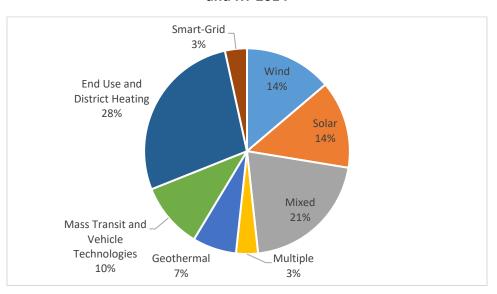

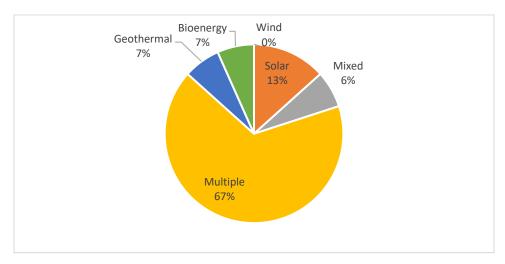

Figure 13: Distribution of technologies in CTF projects first reporting results between RY2019 and RY2021

3.1.2 Private vs. public sector

61. Results also vary between private sector and public sector projects. Figure 14 shows the breakdown of results by private and public sector across GHG emissions reductions, co-financing, and installed capacity. Public sector projects are generally larger in size in terms of target indicators and average financing. For example, public sector projects for renewable energy and energy efficiency on average receive six times more CTF financing than private sector projects. This reduced scale has meant private sector projects have become operational and have generated results more quickly than public sector projects with larger funding envelopes and more ambitious results targets. Private sector projects have driven much of the CTF portfolio's early results reporting, but it is expected that public sector projects will feature far more prominently as they progress in their implementation and achieve more significant results in line with their larger targets.

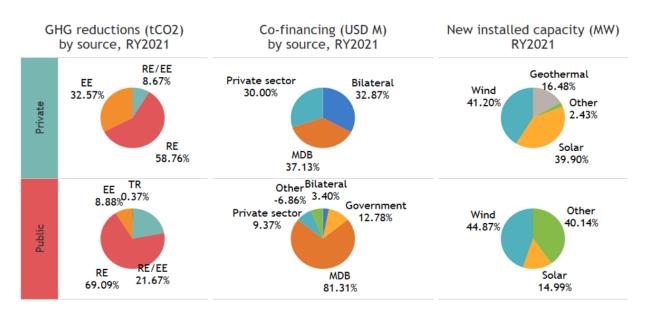

Figure 14: Comparison of public sector and private sector portfolio

62. Public sector projects constitute a larger share of the CTF portfolio in terms of the number of projects and overall CTF financing, accounting for 70 percent of the total CTF financing. Additionally, public sector projects are the largest contributor to each key indicator individually. However, private sector projects as a whole are closer to achieving their targets across the different core indicators.

Table 1: Breakdown of CTF portfolio between public and private sector

| | Public sector | Private sector |
|--|---|---|
| GHG emissions reductions: | | |
| Share reporting achieved results in RY2021 (number of total) | 23 of 55 public sector projects | 25 of 48 private sector projects |
| Largest contributor in RY2021 (amount, share) | Private Sector Renewable Energy and Energy Efficiency Project in Turkey (World Bank) at more than 3 | Private Sector Bank-Intermediated Project (TURSEFF II, TurREFF, Near Zero Waste) (EBRD) at 1,411,754 tCO ₂ (22 percent of the private sector projects in RY2021) |

| | MtCO ₂ /yr (25 percent of the RY2021 | |
|---|--|--|
| | actual) ²⁴ | |
| Annual GHG emissions | 29 percent | 38 percent |
| reductions target | | |
| Co-financing: | | |
| Share leveraging co-financing in RY2021 | 17 of 51 projects | 17 of 44 projects |
| Largest amount leveraged RY2021 (share) | Noor II and III Concentrated Solar Power Project (AfDB - World Bank) at USD 974 million (80 percent of the RY2021 total) | Private Sector Geothermal Energy Program in Indonesia (ADB) at USD 226 million (95 percent of the RY2021 total) |
| Largest amount leveraged cumulatively (share) | The Private Sector Renewable Energy and Energy Efficiency Project in Turkey (World Bank) at USD 3 billion (21.4 percent of the cumulative total) | The Private Sector Geothermal Program in Indonesia (ADB) USD 1,964 million (25 percent of the cumulative total) |
| Source of largest portion of RY2021 financing (percent) | MDBs, 86 percent | MDBs, 37 percent |
| Cumulative co-financing percentage of target | 43 percent | 54 percent |
| Installed capacity: | | |
| Share with new capacity in RY2021 | 5 of 32 projects ²⁵ reported new installed capacity in RY2021 | 6 of 29 projects reported new installed capacity in RY2021 |
| Largest amount of RY2021 installed capacity | Renewable Energy Integration Project in Turkey (World Bank) at 199 MW | Regional project DPSP II: SMed Private Renewable Energy Framework (SPREF) (EBRD) at 120 MW, 42 percent |
| Largest amount of cumulative installed capacity | Shared Infrastructure for Solar Parks Project in India (World Bank) at 1,000 MW, 20 percent of the cumulative total | Private Sector Bank-Intermediated Project (TURSEFF II, TurREFF, Near Zero Waste) in Turkey (EBRD) at 325 MW, 10 percent |
| Technology with largest share of RY2021 new capacity | Wind at 47 percent of new installed capacity | Wind at 41 percent of new installed capacity |
| Cumulative percent of target | 24 percent | 56 percent |
| Energy savings: | p | |
| Share with energy savings in | 11 of 14 projects reported energy | 8 of 13 projects reported energy |
| RY2021 | savings in RY2021 | savings in RY2021 |
| Largest contributor (share) | Private Sector RE and EE Project (Turkey, World Bank) produced the largest amount of RY2021 energy savings at 1424 GWh/yr, 48 percent of the total | Private Sector Sustainable Energy Financing Facility (Turkey, EBRD) produced the largest amount of RY2021 energy savings at 1,509 |

²⁵ Projects with an installed capacity target.

²⁴ This project has been completed and its numbers are no longer being reported to the MDBs. The CIF Administrative Unit uses the last reported number for completed project as a proxy.

²²

| | | GWh/yr, 65 percent of all private sector projects |
|----------------------------------|--|--|

| Passengers per day: | | |
| Share reporting achieved results | Three projects reported 289,868 passengers per day | NA (There are no private sector projects targeting passengers per day) |
| Percent of target | 14 percent | NA |

3.1.3 Co-benefits and development impacts

- 63. While CTF is designed to provide developing countries with scaled-up financing for the demonstration, deployment, and transfer of low-carbon technologies with significant potential for long term GHG savings, alongside emissions reductions, projects also contribute to a host of other development outcomes. Sometimes called "co-benefits," these social and economic outcomes are generally difficult to assess and measure but can significantly strengthen the case for increased climate finance. They include effects on job creation, improved health, increased economic activity, market development, and gender equality impacts, as well as the distribution of these benefits and any unintended outcomes.
- 64. These outcomes are also often specific to the location and approach of the project, and these variations are inherent to the nature of the portfolio, since CTF provides financing through the six MDBs, each with its own set of strategic development priorities. By mapping and measuring these co-benefits or development impacts, CTF intends both to gain a robust understanding of the wider impacts of climate projects and to maximize positive externalities wherever possible.
- 65. In 2019 CIF launched a dedicated learning workstream to understand and quantify the social and economic development impacts of climate investments (SEDICI). This workstream is aimed at increasing the knowledge base on development impacts of climate finance, strengthening the investment case for climate programs, and giving decision makers improved ways of analysing climate investments for both climate and other development outcomes.
- 66. Within the first of its two phases, the workstream analyses potential impacts via economic modelling tools. After extensive desk research, the team chose three models best suited for estimating the non-climate impacts of the CIF portfolio—the Employment Factors Approach (EFA), focussed on renewable energy technologies; the International Jobs and Economic Development Impacts (I-JEDI) Model, with the publicly available version currently only carrying country-specific data for five countries; and the Joint Impact Model (JIM), utilising social accounting matrices, a form of input-output modelling.
- 67. **Direct Jobs:** Of these models, the EFA uses technology- or industry-specific employment factors, multiplied with the respective installed capacity, to estimate direct job impacts during three project phases: manufacturing, installation (construction), as well as operations and maintenance (O&M). Using EFA, at the completion of its portfolio of projects, CTF is estimated to contribute to direct employment of approximately 766,000 manufacturing person-years (about 569,000 in the same regions as projects), approximately 1,422,000 installation person-years, and roughly 76,000 O&M jobs.

Figure 15: Employment factors: Top line results

EMPLOYMENT FACTORS: TOP LINE RESULTS **Estimated Direct Manufacturing & Installation Jobs** Estimated Direct 0&M Jobs (Person-years employment, by end of program) (Permanent jobs, by end of program) 1,600,000 30,000 80,000 30,000 1,400,000 70,000 Person-Years Employment 25,000 25,000 1,200,000 60,000 Permanent Jobs Installed Installed Capacity 20,000 20,000 1,000,000 50.000 800,000 15.000 40,000 15,000 Capacity 30.000 600,000 10.000 10.000 400.000 20,000 5.000 5,000 200,000 10,000 Total all RET Total all RE Wind Manufacturing, in Region Installation Manufacturing, Total 0&M Jobs **Projected Installed Capacity**

- 68. The results represent a planned installed capacity of 25,682 MW, disaggregated by the different types of Renewable Energy Technology (RET) (Figures 15,above)— 16,022 MW of solar PV (62 percent); 5,286 MW of wind (20 percent); 2,623 MW of hydropower (10 percent); 1,650MW of geothermal energy (6 percent); and 102 MW of biomass-based capacity additions (0.4 percent). Technology types, as disaggregated above, were also influential in driving differences in results. In manufacturing, the technology-specific multipliers for small-hydro and solar dwarfed those in other RETs, with 1.5–3.8x as many total jobs created per MW in these technology sectors. However, for solar, wind, and geothermal technologies, the model's current coefficients for in-region manufacturing are influenced by the assumption that a large share of these sectors' manufacturing operations are housed in developed economies (and therefore, not in CTF's investee countries). These technologies, therefore, show a significant difference in total vs. in-region manufacturing jobs generated. It is assumed that the entirety of manufacturing for biomass and hydro-based generation occurs in the region.
- 69. Indirect Jobs: Induced, Supply Chain and Energy-Enabled: Calculated via the JIM, the portfolio is also expected to support 1.7 million person-years of supply chain employment (26% for women) and over 1.3 million person-years of induced employment (29% for women) during project construction phases. The additional power produced by the portfolio is estimated to support nearly 500,000 jobs for each year of full project operations.
- 70. **Phase II:** The impact pathways of these sectors and their broader effects will be fully delineated in Phase II of the learning stream: a development impact (DI) evaluation, awarded in March 2021 to Industrial Economics, Incorporated (IEc), is currently being executed and will aid in refining the accuracy of modelling findings, while fleshing out the relevance and rationales of the results. The DI Evaluation will also explore other categories of development impact, including social impacts such as livelihoods and health outcomes or market-level impacts on strengthening industries and systems, while also conducting a deeper analysis of qualitative outcomes such as job type and quality or community engagement that cannot be captured by quantitative analyses. At the portfolio level the

evaluation will look to refine modelling attributes, whereas at the CIF program and project levels it will deploy a combination of comparative case studies, both light-touch and deep-dive, distributed among key sectoral themes and development impact categories (e.g. social, economic, environmental and markets impacts). Findings are expected to be finalised by December 2021. Along with building the knowledge base of CIF's learning stream, the findings from the DI evaluation will also allow CIF and its partners to customize and test the models that will be utilized for regular portfolio-level development impact estimations hereon.

71. CTF projects contribute to a variety of the UN Sustainable Development goals ranging from deployment of clean energy to development of local industry. Figure 16 below highlights the key SDGs that CTF projects directly contribute to.

Figure 16: CTF's contributions to the UN Sustainable Development Goals²⁶ ²⁷ ²⁸

²⁶ Project count as per Portfolio Management Team data

²⁷ Data as of December, 31 2020

²⁸ Data includes project that are not reporting results

- 72. **SDG 1:** No Poverty: The CTF portfolio contributes significantly to SDG1, measuring the reduction in vulnerabilities of populations facing the greatest economic risks as per sub-goal 1.4, ²⁹ as illustrated by the following examples.
- 73. In South Africa, the ESKOM project (AfDB and World Bank) has led to the creation of 540 jobs to support the projects wind and battery storage operations. The CSP component at the Xina plant has led to the creation of at least 92 jobs.
- 74. In West Africa, the DPSP III: Regional Off-Grid Electrification Project (World Bank) is expected create 300 jobs and provide technical support to 35 women-led companies.
- 75. In Kazakhstan, the District Heating Energy Efficiency Project (World Bank), has enabled over 55,000 people to gain access to more energy-efficient cooking and/or heating facilities, resulting in 95 million mega joules in fuel savings.
- 76. **SGD 9: Industry, Innovation and Infrastructure:** A high percentage of the CTF portfolio also contributes to co-benefits under SDG9: tracking how the provision of high-quality, reliable, and resilient infrastructure has significant effects on the "economic development and human well-being, with a focus on affordable and equitable access for all." 30
- 77. In West Africa, the DPSP III: Regional Off-Grid Electrification Project (World Bank) is expected to enable 57 commercial financial institutions to support solar companies.
- 78. In Turkey, the Renewable Energy Integration Project (World Bank) constructed over 70km of transmission lines to allow the integration of over 374 MW wind energy to substations.
- 79. In Ukraine, the Second Urban Infrastructure Project (World Bank) has rehabilitated over 978,000 pipe household water connection systems, overachieving its initial target of 550,000.
- 80. **SDG 11:** Sustainable Cities and Communities: SDG 11 includes "reducing the adverse per capita environmental impact of cities," measured by changes in the annual mean levels of fine particulate matter (e.g. PM2.5 and PM10) in cities. ³¹ The CTF portfolio has shown co-benefit contributions to this SDG in several countries, including the following.
- 81. In Indonesia, the Geothermal Clean Energy Investment Project (World Bank)has removed 10,000 tons of combined NO_x, SO₂ and total suspended particulates (TSP) annually, which translates to approximately USD 20 million in health benefits per year as a result of improved air quality and respiratory health benefits. The monetized value is estimated with the benefit transfer method whereby the monetized value of health damages incurred by emissions of NOx, SO2, and TSP from coal-based power generation is considered a relative benefit of geothermal power generation. The coal damage costs of the three types of pollutants are estimated by using damage cost factors, which

²⁹ By 2030 ensure that all men and women, particularly the poor and the vulnerable, have equal rights to economic resources, as well as access to basic services, ownership, and control over land and other forms of property, inheritance, natural resources, appropriate new technology, and financial services including microfinance

³⁰ https://sustainabledevelopment.un.org/sdg9

³¹ https://sustainabledevelopment.un.org/sdg11

- are USD 0.95 per kg for NOx, USD 0.0019 per kg for SO2, and USD 0.0062 per kg for PM10 in Indonesia. 32
- 82. In Morocco, the Noor Ouarzazate CSP Project (AfDB and World Bank) has seen a combined annual reduction of over 5,000 tons of SO_2 and NO_x in addition to some 347,780 tons of CO_2 emissions reductions.
- 83. In Ukraine, the Second Urban Infrastructure Project (World Bank), over 40,000 tons of industrial and municipal waste is expected to be recycled, while the project has supported 10 water utilities to support efficiency in waste management technologies.³³
- 84. Other co-benefits that are selected based on the individual projects' anticipated impacts include the following:
 - Energy security
 - Number of firms implementing new performance-based energy contracts
 - Commercial/industrial sites implementing self-supply renewable solutions with direct CTF support
 - Reductions in operating costs
 - Increased competitiveness of the corporate/SME sector
 - Increased capacity of the local banking sector to finance commercial investments in sustainable energy
 - Demonstration of commercial viability of sustainable energy finance
 - Reduction in electricity cost
 - Diversification of country energy mix
 - Continuing support to sector reform and contribution to government objectives

- Increased local manufacturing through local content requirements
- Fostering rural development
- Participation by historically disadvantaged citizens and marginalized regions
- Improved access to finance
- Better quality housing
- Strengthened local manufacturing capacity
- Improved the reliability of electricity supply
- Reduction of traffic accidents and congestion
- Reduced power losses
- Increased access to electricity
- 85. The preceding examples of development impacts resulting from CTF financing are based on projects that have reported on these. It should be noted that reporting on development indicators is not an annual mandatory requirement of the original CTF Results Framework.

4. Lessons from Completed Projects

- 86. When fully-disbursed projects reach closure, MDBs prepare an Implementation Completion Report (ICR) or Project Completion Report (PCR) and submit them to the CIF Administrative Unit to conclude their CTF results reporting requirement. These documents are designed to satisfy accountability needs and provide lessons from completed operations.³⁴ In some cases, an independent review of an ICR (an ICR review or ICRR) is also conducted.³⁵
- 87. The CIF Administrative Unit has received at least one type of completion document for nine projects (see Table 2). Across them, two common themes have emerged: the need for strong policy/institutional support on the government side and the need for concessional financing to mitigate the risk of a project (see Table 3). Five projects cited strong government support (in the form of policies and institutions implemented prior to project start) as a reason for success, while three projects mentioned the importance of concessional financing for a project's success. All but one project has an outcome rating of satisfactory or higher.

Table 2: Summary of completed CTF projects

| Country/Region | Project | MDB | Sector | Public or |
|----------------|---|-------|--------|-----------|

Table 3: Excerpts from CTF project completion documents on common themes

| Need for strong policy/institutional support on the government side | Importance of concessional financing to mitigate the risk of a project |
|--|---|
| Projects are designed in alignment with clear government strategies and based on sector specific sound technical studies and a clear road map. As with other operations, the success of this major pillar of the 24 developmental policy loan relied to a large extent on the commitment and ownership shown not only by the political authorities at the highest level but also by executing agencies. Strong commitment of the government is a prerequisite for energy transitions. Policy and regulatory support is critical for the transformational impact and sustainability of credit lines Strong government commitment can considerably improve prospects for achieving the project development objective | The concessional CTF loan combined with an IBRD loan made the project viable by bringing capital costs down, which reduce the financial risk of a project Reducing the costs of funding for the project was critical for its economic success by securing the financing from several IFIs at concessional rates, enabling the implementing agency to repackage the funding and on-lending it to the project company, and informing the bidders of the terms and conditions of the loan at the start of the tender process. |
